

PROBABILITY

UDAY KUMAR - FWC22086

16.4.2 ¹Four cards are drawn from a well-shuffled deck of 52 cards. What is the probability of obtaining 3 diamonds and one spade?.

Solution:

Let the cards drawn from the deck be $X = \{0, 1, 2, 3\}$ and $Y = \{0, 1\}$, where **0** denotes the card is from diamonds and **1** denotes the card is from spades. The desired set of selecting diamonds $\{00, 10, 20\}$ and selecting one spade is $\{31\}$

Probability of selecting 3 diamonds and one spade is

$$P(00, 10, 20, 31) = \frac{{}^{13}C_3 \times {}^{13}C_1}{{}^{52}C_4}$$

$$\therefore P(00, 10, 20, 31) = \frac{286}{20285}$$
